

How Data is Represented in a Computer

<i>Binary Digit</i>	0	1
<i>Bit</i>		
<i>Status</i>	OFF	ON

How Data is Represented in a Computer (con't)

How Data is Represented in a Computer (con't)

- Bit - the smallest unit of data handled by a computer (short for binary digit).
- Byte - a group of 8 bits.

Number Systems

- Computers use three types of number systems:
 - Decimal number system
 - Binary number system
 - Hexadecimal number system

Number Systems (con't)

<i>DECIMAL</i>	<i>BINARY</i>	<i>HEXADECIMAL</i>
<i>0</i>	<i>0000</i>	<i>0</i>
<i>1</i>	<i>0001</i>	<i>1</i>
<i>2</i>	<i>0010</i>	<i>2</i>
<i>3</i>	<i>0011</i>	<i>3</i>
<i>4</i>	<i>0100</i>	<i>4</i>
<i>5</i>	<i>0101</i>	<i>5</i>
<i>6</i>	<i>0110</i>	<i>6</i>
<i>7</i>	<i>0111</i>	<i>7</i>
<i>8</i>	<i>1000</i>	<i>8</i>
<i>9</i>	<i>1001</i>	<i>9</i>
<i>10</i>	<i>1010</i>	<i>A</i>
<i>11</i>	<i>1011</i>	<i>B</i>
<i>12</i>	<i>1100</i>	<i>C</i>
<i>13</i>	<i>1101</i>	<i>D</i>
<i>14</i>	<i>1110</i>	<i>E</i>
<i>15</i>	<i>1111</i>	<i>F</i>

Decimal Number System

- We (humans) use the decimal number system
- Base 10 number system
- *deci* means ten
- 10 symbols are used - 0 thru 9

Decimal Number System (con't)

<i>power of 10</i>	10^2	10^1	10^0	1	4	3	=			
<i>positional value</i>	100	10	1	(1×10^2)	$+ (4 \times 10^1)$	$+ (3 \times 10^0)$	=			
<i>number</i>	1	4	3	(1×100)	$+ (4 \times 10)$	$+ (3 \times 1)$	=			
				100	+	40	+	3	=	143

Binary Number System

- Computers use binary in calculations, storage and data transmission.
- Base 2 number system
- *Bi* means two
- Two symbols are used - 0 and 1

Binary Number System

<i>power of 2</i>	2^3	2^2	2^1	2^0	1	0	0	1	=				
<i>positional value</i>	8	4	2	1	$(1 \times 2^3) + (0 \times 2^2) + (0 \times 2^1) + (1 \times 2^0) =$								
<i>binary</i>	1	0	0	1	$(1 \times 8) + (0 \times 4) + (0 \times 2) + (1 \times 1) =$								
					8	+	0	+	0	+	1	=	9

Number Systems

- Conversion of decimal to binary
 - Reverse the process.
 - 59 is 00111011 in binary.
 - Start with position that is less than the original #.
 - 59 is less than 64, so start with 32.
 - Continue to the right accumulating and placing a “1” at those positions until total = 59.

128	64	32	16	8	4	2	1	
0	0	1	1	1	0	1	1	10

Hexadecimal Number System

- Computers use hexadecimal because it represents binary values in a compact form.
- Base 16 number system
- *Hex* means six, *Deci* means ten
- 16 symbols are used - 0 thru 9, A, B, C, D, E, F
 - 0-9 = 0-9
 - A = 10 D = 13
 - B = 11 E = 14
 - C = 12 F = 15

Hexadecimal Number System (con't)

<i>power of 16</i>	16^1	16^0	A	5	=
<i>positional value</i>	16	1	(10×16^1)	$+ (5 \times 16^0)$	=
<i>hexadecimal</i>	A	5	(10×16)	$+ (5 \times 1)$	=
			160	+ 5	= 165

Hexadecimal Number System (con't)

- Conversion of decimal to hexadecimal
 - Reverse the process
 - 59 is 3B in hexadecimal
 - 16 goes into 59 three times
 - It will take “11” or “B” to get to 59 ($59 = 3 * 16 + 11$)

4096	256	16	1
		3	B (11)
